

Signals - CLI to manage your progress

Signals is a filebased, *functional* CLI to manage append only logs of signals and events. Signals is inspired by the concept of **Goals, Signals and Measures** described here: [Goals, Signals and Measures](#)

Getting Started

Getting started with signals is simple.

1. Clone this repository into a directory of your choosing.
2. `npm install` to gather dependencies.
3. Add any `<signal-collection>.md` file to the collections folder. Where `<signal-collection>` is the name of your collection.
4. Either use `npm start` to run the CLI in place or run 'npm link' to use `signals` on the command line anywhere.

Message Types

- **Signals:** Represent log entries that directly contribute to the signal that you are tracking.
- **Events:** Represent information log entries that are related to the signal you are tracking that may provide context or other information related to the signal. Events are **not** signals and do not count towards any metric.

Tool Roadmap

- [] Log style console visualisation for a signal collection.
